DETAILED ACTION

EXAMINER'S STATEMENT FOR REASONS FOR ALLOWANCE

Claims 24-35 are allowable over prior art.

The following is an examiner's statement of reasons for allowance: claims 24-35 are allowed because the references cited fail to teach, as applicant has, an inductively loaded folded cascode circuit that inputs an input differential signal having referenced output level and outputs a current; an input current load circuit that inputs the current from the inductively-loaded folded cascode circuit and outputs an output differential signal having a ground-referenced output level; a plurality of gain cells, each gain cell coupled to the input current load circuit and receiving the output differential signal, each gain cell comprising two current mirror circuits; and a plurality of switching circuits, each switching circuit coupled to one of the plurality of gain cells and each switching circuit operating in a positive mode and in a negative mode, the negative mode having an opposite polarity to the positive mode, and wherein the plurality of switching circuits operate to place more of the plurality of gain cells in the positive mode than in the negative mode, as the applicant has claimed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Rofougaran ("A Single-chip 900 MHz Spread Spectrum Wireless Transceiver in 1- μ m CMOS-Part I: Architecture and Transmitter Design, IEEE J. of Sol. State Circuits, 3rd ed Vol. 33 (No. 4) pp. 515-534 (1998)) discloses in figure 26 pages 526-528 a power amplifier circuit with a plurality of gain cells, each gain cell coupled to an input current load circuit and receiving an output differential signal, each gain cell comprising two current mirror circuits; and a plurality of switching circuits, each switching circuit coupled to one of the plurality of gain cells. Rofougaran doesn't disclose that each switching circuit operating in a positive mode and in a negative mode, the negative mode having an opposite polarity to the positive mode, and wherein the plurality of switching circuits operate to place more of the plurality of gain cells in the positive mode than in the negative mode, as the applicant has claimed
